

# Theory of Use for Professional Practice Measures

Information

- Professional practice measure creates information about the level of teaching skill demonstrated by each teacher

New Insights

- Information leads to new insights about teaching

Practice and Learning

- Insights lead to the acquisition of new understandings and strategies through professional development, utilization of new tools, etc.

Changes in Teaching

- Understandings and strategies are incorporated into teaching practice, making it more effective

Changes in Learning

- Effective teaching practice results in improved student learning

Table 1. Theory of Professional Practice Score Use, Interpretive Argument and Exemplar Analyses for the Improvement of Teaching, Applied to Observation Protocols

| Theory of Use   | Interpretive Argument   | Exemplar Analyses  |
|---|---|--|
| Professional practice measure creates information about the level of teaching skill demonstrated by each teacher. | IA1. The scoring rule is appropriate.   | <ul style="list-style-type: none"> <li>• Assess the overlap between score point descriptors.</li> <li>• Assess the clarity of scoring criteria (e.g., Can observers tell the difference between some and most? Between high-level questions and mid-level questions?).</li> <li>• Assess the degree to which observers use all the score points and whether that is reasonable given other knowledge of variation in teaching performance.</li> <li>• Assess the degree to which the distribution of scores matches other knowledge of variation in teaching performance.</li> </ul>   |
|   | IA2. The scoring rule is applied accurately and consistently.   | <ul style="list-style-type: none"> <li>• Assess the degree to which observers and master observers' scores on the same lessons match.</li> <li>• Assess the degree to which two observers scoring the same lesson assign similar scores.</li> </ul>  |
|   | IA3. The scoring is bias free.  | <ul style="list-style-type: none"> <li>• Investigate the assignment of observers to teachers and the assignment of double scoring observers.</li> <li>• Assess the degree to which similarities and differences across various groups of teachers (e.g., by grade level, subject area, race, school) are appropriate.</li> <li>• Compare scores of observers when they are scoring within or outside of their subject areas.</li> </ul>  |
|   | IA4. The data fit the scoring model.  | <ul style="list-style-type: none"> <li>• Conduct factor analyses on scores to determine consistency between theorized domains and empirical domains.</li> </ul>  |
|   | IA5. The sample adequately represents the quality of all relevant lessons.                                | <ul style="list-style-type: none"> <li>• Investigate the sources of variation in scores (e.g., observer, lessons, time of year) through analyses such as g-studies.</li> <li>• Analyze how many lessons one would need to observe to have a reliable estimate for one year. (This presumes one is generalizing to all the teaching in a single section of students.)</li> <li>• Determine how many different classes one might need to observe for a stable estimate. (This presumes one is generalizing to all the teaching a teacher does across groups of students.)</li> <li>• Investigate the degree to which scores vary over school years.</li> </ul> |
|   | IA6. The score on all lessons is related to the teaching quality teachers and students are able to enact. | <ul style="list-style-type: none"> <li>• Assess the correlations among measures designed to measure related constructs (e.g., student reports of teacher practices and observer reports of teacher practices).</li> <li>• Assess the degree to which teachers identified in the tails of the observation distribution (e.g., top 10%) are in similar locations on other measures' distributions.</li> </ul>  |

|   |  |  |
|---|--|--|
|   | IA7. There are not systematic errors that undermine the extrapolation to teaching quality.   | <ul style="list-style-type: none"> <li>Investigate the influence of systematic errors (e.g., the influence of curriculum, the sorting of students to teachers, the sorting of teachers to students, grade level teaming, co-teaching).</li> </ul>  |
| Information leads to new insights about teaching  | IA8. Stakeholders understand the information the system produces.  | <ul style="list-style-type: none"> <li>Investigate evaluators' and teachers' perceptions of what they learned from the information the system produced.</li> <li>Assess the degree to which scores nominate the same areas of strength and weakness nominated on non-observation measures.</li> </ul>  |
|   | IA9. Insights are appropriately and accurately related to the system information.  | <ul style="list-style-type: none"> <li>Investigate the degree to which evaluators' written and verbal feedback was accurate and appropriate.</li> <li>Analyze the focus and frequency of specific insights of evaluators and teachers. Compare to expert analyses of patterns in the information.</li> </ul>   |
|   | IA10. Insights are actionable.   | <ul style="list-style-type: none"> <li>Analyze the degree to which insights are consistent with research literature on productive feedback.</li> <li>Investigate the degree to which teachers perceived they knew what to do with the insights generated.</li> </ul>   |
| Insights lead to the acquisition of new understandings and strategies, through professional development, utilization of new tools, etc. | IA11. The implications associated with teaching performance are appropriate.   | <ul style="list-style-type: none"> <li>Share videos of performance at different points in the score distribution and investigate the degree to which stakeholders view the implications associated with those score points as appropriate (e.g., a person with a representative video that shows poor classroom management performance is required to attend classroom management workshops for the school year).</li> </ul>                                       |
|   | IA12. The properties of the observed scores on the lessons support the implications associated with the judgments of teaching performance. | <ul style="list-style-type: none"> <li>Investigate the stability of scores over student populations, grade levels, and subject areas.</li> <li>Conduct analyses that specify misclassification errors and levels of uncertainty.</li> </ul>  |
|   | IA13. Stakeholders link insights with appropriate tools, learning opportunities, etc.  | <ul style="list-style-type: none"> <li>Investigate the alignment between the tools and professional development activities teachers engage and their areas of demonstrated strength and weakness.</li> </ul>   |
|   | IA14. Learning opportunities and resources are appropriate and of sufficient quality to support teacher learning.                          | <ul style="list-style-type: none"> <li>Analyze the prevalence, coherence, timing, and quality of professional development opportunities available to teachers.</li> <li>Analyze the content and learning goals of professional development opportunities available to teachers.</li> <li>Analyze the content and utility of district resources available to support teachers' development (e.g., investigate curriculum supports, pacing guides, etc.).</li> </ul> |

|--|---|---|
| <p>Understandings and strategies are incorporated into teaching practice, making it more effective</p> | <p>IA15. Organizational context supports incorporation of new understandings/strategies.</p>                                  | <ul style="list-style-type: none"> <li>• Identify teachers who have improved on specific dimensions and investigate what they did to improve. Compare to non-self report measures.</li> <li>• Investigate teachers' perceptions about the support for their implementation of new understandings and strategies.</li> </ul>   |
|  | <p>IA16. Changes in teaching practice substantively align and are attributable to use of resources/professional learning.</p> | <ul style="list-style-type: none"> <li>• Investigate stakeholders' perceptions of what they have learned, to what degree they have implemented their learning, and what impact implementation has had on their practices.</li> <li>• Conduct logical analyses that document other sources of influence on changes in teaching practices.</li> <li>• Randomly assign teachers with similar needs to different professional development/resources and study changes in teaching practices.</li> </ul> |
| <p>Effective teaching practice results in improved student learning</p>                                | <p>IA17. Measures of student learning are sensitive to changes in teaching practice.</p>                                      | <ul style="list-style-type: none"> <li>• Investigate the degree to which measures of student learning are sensitive to known differences in teaching practice.</li> <li>• Investigate the relationship between changes in student learning and changes in scores on teaching practice measures at different points of proficiency for the teaching practice measures.</li> </ul>  |
|  | <p>IA18. Changes in student learning are attributable to changes in teaching practice.</p>                                    | <ul style="list-style-type: none"> <li>• Investigate the degree to which other measures one would expect to reflect changes consistent with improved effectiveness actually demonstrate the theorized changes (e.g., observation scores, self-reported proficiency, student surveys around specific practices, VAM, etc.).</li> <li>• Analyze the degree to which changes in various measures of the teacher evaluation system predict student learning.</li> </ul>                                 |
