

# *What Works?: Exploring State Accountability Indicators to Promote Validity, Equity, and Improvement*

Brian Gong

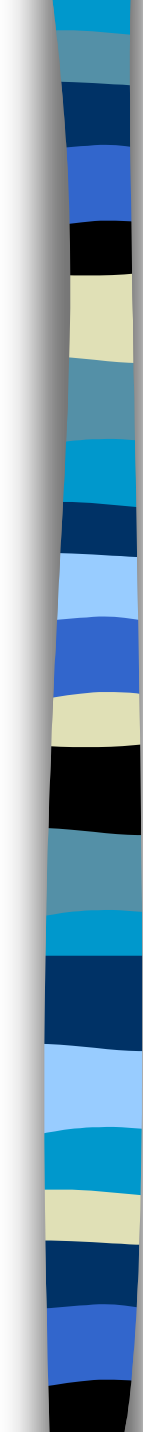

The National Center for the Improvement of  
Educational Assessment

Presentation to the AERA State Indicators  
Special Interest Group, Montreal, April 1999

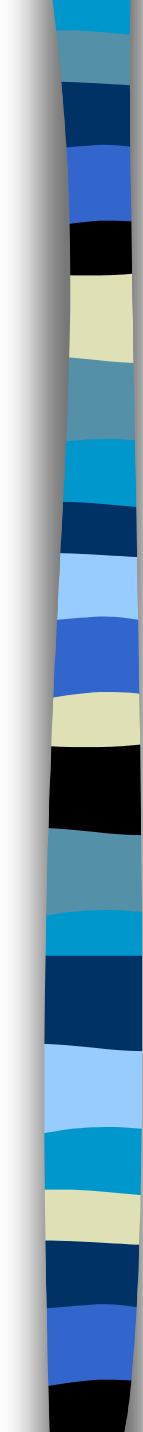

# Assessment and accountability systems reflect unique situations.

- Each state is different, because of history, policy players, resources, perceived priorities, sense of “what has already been done” and “what is possible.”
- Assessment and accountability system designs are constructed within these circumstances.

# State school accountability systems aggregate data to make decisions and simplify reporting.

- Most states use at least three indicators
  - most widely used for accountability are test scores, student attendance, and dropout; revenue and expenses also reported by majority of states
- Most states report data aggregated at least three levels, some as many as seven

Analysis can help provide validity evidence and focus improvement efforts.

- Each state is unique; needs design that fits state's values and situation.
- Analysis supports efficacy of standards-based educational reform efforts.
- Analysis helps direct improvement efforts, including community support.
- Example: race/ethnicity analysis in three states

# Kentucky's assessment system includes multiple measures.

- Two grades each in elementary, middle, and one in high school take state-mandated tests.
- State custom CRTs include seven areas: reading, writing, math, science, social studies, arts & humanities, and practical living/vocational studies. NRT in reading and math also required.
- Tests include multiple choice and constructed response, common and matrix. Writing Portfolios also used. Alternate Portfolio used for alternate assessment.
- Noncognitive measures include attendance, dropout retention, and successful transition to adult life.

# Kentucky's school accountability system emphasizes improvement.

- An *index* is constructed annually for each school reflecting performance on CRT and noncognitive measures.
- A *baseline index* averages two years' scores.
- A *growth target* is calculated, based on the baseline index.
- A *growth index* averages the two years' scores subsequent to the baseline.
- *Rewards, sanctions, and targeted assistance* from the state are assigned based on schools' growth compared to their growth targets.

# Kentucky's design highlights important policy decisions.

- Assessment policies support instructional policies.
- Effort made to include all students in accountability and “count” each student “equally.”
- More subject areas included, longer tests, farther apart, with emphasis on school accountability and comprehensive curriculum modeling, and less on student accountability and testing efficiency.
- Compensatory index used, with a few conjunctive rules for accountability.
- Nominal accountability weights for noncognitive factors low, effective weights even lower.

# Kentucky's design highlights important policy decisions (cont.).

- Baselines reset every accountability cycle, up or down, and growth targets set accordingly.
- Accountability school performance judgments trigger (appealable) school consequences, including further school and personnel review. Personnel decisions triggered by separate process.
- Growth targets set to bring all schools (close to) 100 at same time.
- School consequences based only on improvement; no consideration of how high or low absolute performance.

# Disaggregating results helps with validity and improvement.

- Three examples around race/ethnicity analyses (different analyses using different indicators)
  - Kentucky: school-level equity
  - Louisiana: race/ethnicity and economic class
  - Massachusetts: race/ethnicity, course-taking patterns

# Kentucky: Some equity results

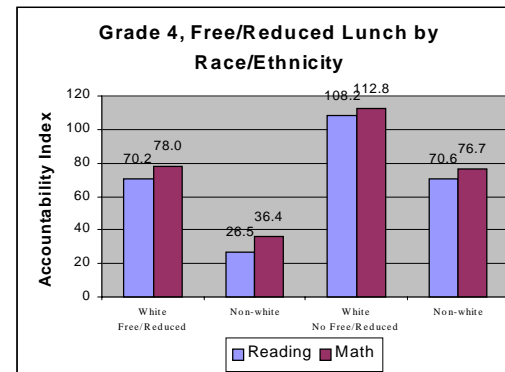

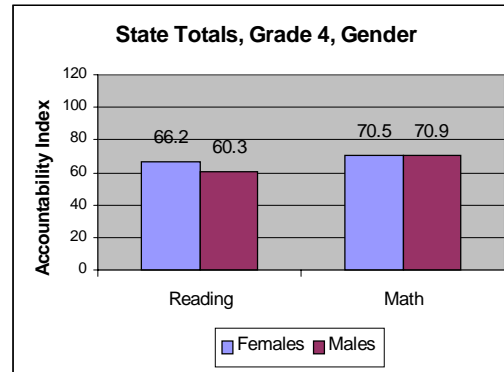

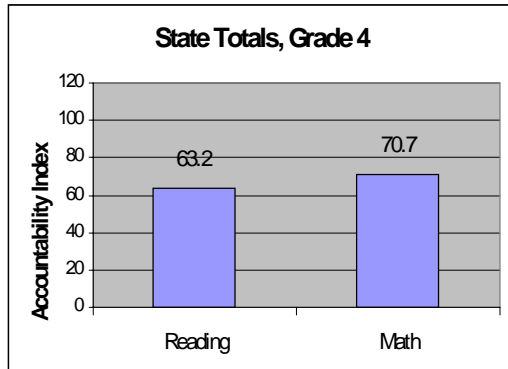

- It was possible for schools to meet improvement goals
- Meeting improvement goals was *not* a function of poverty, race, geography, or “how low a school started”
- Improvements in content areas reflected teacher familiarity, training
- Ethnicity achievement gap varied widely between schools

Kentucky's accountability results not related to race, but consider subgroup performance by school.

Figure 12. Mathematics Plot.

# Analyzing multiple indicators may be informative.

# To improve, states (and districts/schools) should consider additional indicators outside of accountability.

Percent Currently Enrolled in "Beginning" and "On-Sequence" Courses, Science						
	Asian/ Pacific Islander	African American	Hispanic/ Latino	Multiple	Native American	White
Not enrolled <sup>1</sup>	4	38	44	40	29	26
Beginning <sup>2</sup>	21	28	30	30	37	16
On- sequence <sup>3</sup>	58	28	20	30	17	53

<sup>1</sup>Student did not report being currently enrolled in any of the science courses identified in the student questionnaire  
<sup>2</sup>Integrated Science or Biology course  
<sup>3</sup>Chemistry or Physics course

MCAS performance	Commercial test control	Other factors	R-square	Change in R-square
Sci. & Tech.	MAT7 Science		.55	
Sci. & Tech.	MAT7 Science	Biology	.60	.04
Sci. & Tech.	MAT7 Science	Biology, Geometry	.61	.05
Sci. & Tech.	MAT7 Science	Race/Ethnicity	.56	.01
Sci. & Tech.	MAT7 Science	Biology, Geometry, Race/Ethnicity	.61	.00

Percentage of students who reported having completed a biology course						
MCAS Science Level	Asian/ Pacific Islander	African American	Hispanic/ Latino	Multiple	Native American	White
Failing	19	22	45	25	-	8
Proficient	8	22	9	13	-	34
